Search Notes

Examiner Portner,

Here are the results for your recent search request.

Please feel free to contact me if you have any questions about these results.

Thank you for using STIC services. We appreciate the opportunity to serve you.

Sincerely,

Mary Jane Ruhl

XX
PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 23; Page; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast. Note: This
CC   sequence is not given in the specification, but is decoded from the BoNTB
CC   Hc DNA sequence given on pages 39-40

XX
PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 4b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

CC The present sequence represents a construct of the invention, comprising
CC a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC be cleaved by thrombin, and a heavy chain derived from botulinum
CC neurotoxin serotype B. The specification describes a composition for
CC delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC This component has a domain that binds to a neuronal cell and a domain
CC that translocates the SOD of the composition into the neuronal cell.
CC After translocation, the linker is cleaved to release the SOD. The
CC composition is useful for treating neuronal diseases caused or augmented
CC by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC disease, Huntington's disease and motor neurone diseases

XX
CC The present sequence represents a construct of the invention, comprising
CC a mitochondrial leader sequence from human manganese superoxide dismutase
CC (Mn-SOD), a Bacillus stearothermophilus Mn-SOD, a linker that can be
CC cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin
CC serotype B. The specification describes a composition for delivery of SOD
CC to neuronal cells. The composition comprises SOD linked, by a cleavable
CC linker, to a neuronal cell targeting component (NCTC). This component has
CC a domain that binds to a neuronal cell and a domain that translocates the
CC SOD of the composition into the neuronal cell. After translocation, the
CC linker is cleaved to release the SOD. The composition is useful for
CC treating neuronal diseases caused or augmented by oxidative stress, such
CC as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and
CC motor neurone diseases

PT Recombinant neurotoxin polypeptides - used to develop therapeutic agents,
PT immunogens or as non-toxic standards for the detection of neurotoxins.
XX
PS Example 2; Page 91-94; 137pp; English.
XX
CC The present sequence represents a recombinant neurotoxin protein from the
CC present invention. The present invention describes recombinant neurotoxin
CC proteins which comprise a first and second domain, where the first domain
CC is adapted to cleave one or more vesicle or plasma-membrane associated
CC proteins essential to exocytosis, and where the second domain is adapted:
CC (a) to translocate the protein into a cell; (b) to increase the
CC solubility of the protein compared to the solubility of the first domain
CC on its own, or (c) both to translocate the protein into a cell and to
CC increase the solubility of the protein compared to the solubility of the
CC first domain on its own, the protein being free of clostridial neurotoxin
CC (CN) and free of CN precursor that can be converted into toxin by
CC proteolytic action. The recombinant proteins can be used as therapeutic
CC agents for targeting cells expressing a relevant substrate. The products
CC can also be used as immunogens and as non-toxic standards for the
CC assessment and development of in vitro assays for the detection of
CC functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC environmental samples

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 35; Page 291-296; 428pp; English.
XX
CC This is the amino acid sequence of the type B toxin of Clostridium
CC botulinum Danish strain. The C fragment (see AAW68393-94) of the serotype
CC B toxin has been expressed as a histidine-tagged protein in Escherichia
CC coli. The invention relates to C. botulinum recombinant toxins. Methods
CC are provided which allow for the isolation of soluble recombinant
CC proteins free of significant endotoxin contamination. Preferred hosts for
CC production of the recombinant proteins are E. coli, insect cells and
CC yeast cells. The recombinant proteins are used as immunogens for the
CC production of vaccines and antitoxins that are useful in the treatment of
CC humans and animals at risk of intoxication with clostridial toxin.

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Disclosure; Page 13; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a

CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PS   Example 47; Page 352-353; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum seotype D neurotoxin, encoded by a DNA sequence
CC   (see AAV30591) in plasmid pETHisb. This vector can be used to express
CC   BotD soluble C fragment in Escherichia coli host cells, with the
CC   recombinant C fragment being purified on an affinity column. The
CC   invention relates to recombinant proteins derived from C. botulinum
CC   toxins, especially type B and type E toxins. Methods are provided which
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts are E. coli, insect
CC   cells and yeast cells. The recombinant toxins are used as immunogens for
CC   the production of vaccines and antitoxins useful in the treatment of
CC   humans and animals at risk of intoxication with clostridial toxin

XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (NCTC 11219) type E neurotoxin, encoded by a DNA
CC   sequence (see AAV30585) in plasmid pETHisb. This vector is used to
CC   express BotE soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RL   Nature 358:687-690(1992).
CC   -!- FUNCTION: Probably play a role in the development of the brain and
CC       the sense organs. Can bind to the BCD target sequence (BTS): 5'-
CC       TCTAATCCC-3'.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Probable).
CC   -!- TISSUE SPECIFICITY: Brain: restricted regions of the developing
CC       rostral brain including the presumptive cerebral cortex and
CC       olfactory bulbs; expressed in the developing olfactory, auricolar
CC       and ocular systems, including the covering of the optic nerve.
CC   -!- DEVELOPMENTAL STAGE: Embryo.
CC   -!- SIMILARITY: Belongs to the paired homeobox family. Bicoid
CC       subfamily.
CC   -!- SIMILARITY: Contains 1 homeobox domain.

CC   -!- FUNCTION: Probably play a role in the development of the brain and
CC       the sense organs. Can bind to the BCD target sequence (BTS): 5'-
CC       TCTAATCCC-3' (By similarity). May play a role in the specification
CC       or differentiation of neurons in the deep layers of the cerebral
CC       cortex, and also in cerebellar regionalization during early
CC       development.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Probable).
CC   -!- TISSUE SPECIFICITY: Brain: restricted regions of the developing
CC       rostral brain including the presumptive cerebral cortex and
CC       olfactory bulbs; expressed in the developing olfactory, auricolar
CC       and ocular systems, including the covering of the optic nerve (By
CC       similarity).
CC   -!- DEVELOPMENTAL STAGE: Expressed throughout the forebrain and
CC       midbrain during development, and in addition is also seen in
CC       discrete spatial and temporal domains in the developing cerebral
CC       cortex and cerebellum. Confined to a subpopulation of neurons in
CC       layers 5 and 6 within the adult cerebral cortex and during
CC       development expression is high in the progenitors of these deep-
CC       layer cells. Expressed in the developing cerebellum in spatially
CC       restricted regions of the external granular layer.
CC   -!- SIMILARITY: Belongs to the paired homeobox family. Bicoid
CC       subfamily.
CC   -!- SIMILARITY: Contains 1 homeobox domain.

CC   -!- FUNCTION: MULTIFUNCTIONAL TRANSCRIPTION FACTOR THAT EXHIBITS
CC       POSITIVE AND NEGATIVE CONTROL ON A LARGE NUMBER OF CELLULAR AND
CC       VIRAL GENES BY BINDING TO SITES OVERLAPPING THE TRANSCRIPTION
CC       START SITE. MAY PLAY AN IMPORTANT ROLE IN DEVELOPMENT AND
CC       DIFFERENTIATION. THE FUNCTION OF YY1 AS AN ACTIVATOR OR A
CC       REPRESSOR IS SPECIFIED BY THE PRESENCE OF OTHER PROTEINS. FOR
CC       EXAMPLE IT ACTS AS A REPRESSOR IN ABSENCE OF ADENOVIRUS E1A
CC       PROTEIN BUT AS AN ACTIVATOR IN ITS PRESENCE.
CC   -!- SUBUNIT: Interacts with YAF2 through the region encompassing the
CC       first and second zinc fingers.
CC   -!- SUBCELLULAR LOCATION: Nuclear. Associated with the nuclear matrix.
CC   -!- SIMILARITY: BELONGS TO THE KRUEPPEL FAMILY OF C2H2-TYPE ZINC-
CC       FINGER PROTEINS.
CC   -!- SIMILARITY: Contains 3 C2H2-type zinc fingers.

CC   -!- FUNCTION: MULTIFUNCTIONAL TRANSCRIPTION FACTOR THAT EXHIBITS
CC       POSITIVE AND NEGATIVE CONTROL ON A LARGE NUMBER OF CELLULAR AND
CC       VIRAL GENES BY BINDING TO SITES OVERLAPPING THE TRANSCRIPTION
CC       START SITE. MAY PLAY AN IMPORTANT ROLE IN DEVELOPMENT AND
CC       DIFFERENTIATION. THE FUNCTION OF YY1 AS AN ACTIVATOR OR A
CC       REPRESSOR IS SPECIFIED BY THE PRESENCE OF OTHER PROTEINS. BINDS TO
CC       THE UPSTREAM CONSERVED REGION (UCR) (5'-CGCCATTTT-3') OF MOLONEY
CC       MURINE LEUKEMIA VIRUS (MULV).
CC   -!- SUBUNIT: Interacts with YAF2 through the region encompassing the
CC       first and second zinc fingers (By similarity).
CC   -!- SUBCELLULAR LOCATION: Nuclear. Associated with the nuclear matrix.
CC   -!- SIMILARITY: BELONGS TO THE KRUEPPEL FAMILY OF C2H2-TYPE ZINC-
CC       FINGER PROTEINS.

RT   "A subclass of bHLH proteins required for cardiac morphogenesis.";
RL   Science 270:1995-1998(1995).
CC   -!- FUNCTION: Plays an essential role in cardiac morphogenesis.
CC   -!- SUBUNIT: Efficient DNA binding requires dimerization with another
CC       bHLH protein.
CC   -!- DEVELOPMENTAL STAGE: At stage 8, detected in the cardiac crescent.
CC       At stage 10, expressed thoughout the cardiac tube and the sinus
CC       venosus. By stage 15, expressed homogenously in the various
CC       regions of the heart, including the atria, future left ventricle,
CC       bulbus cordis and truncus arteriosus, and in the forming branchial
CC       arches. Expression persists through stage 20, but decreases
CC       thereafter.
CC   -!- SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 35; Page 300-302; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (Eklund 17B strain) type B toxin, encoded by a DNA
CC sequence (see AAV30580) in plasmid pHisBotb. This vector was used to
CC express soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins. Methods
CC are provided which allow for the isolation of soluble recombinant

```
CC   proteins free of significant endotoxin contamination. Preferred hosts for
CC   production of recombinant proteins are E. coli, insect cells and yeast
CC   cells. The recombinant toxins are used as immunogens for the production
CC   of vaccines and antitoxins that are useful in the treatment of humans and
CC   animals at risk of intoxication with clostridial toxin

CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Danish strain) type B toxin, encoded by a DNA
CC   sequence (see AAV30581) in plasmid pETHisb. This vector was used to
CC   express soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins. Methods
CC   are provided which allow for the isolation of soluble recombinant
CC   proteins free of significant endotoxin contamination. Preferred hosts for
CC   production of recombinant proteins are E. coli, insect cells and yeast
CC   cells. The recombinant toxins are used as immunogens for the production
CC   of vaccines and antitoxins that are useful in the treatment of humans and
CC   animals at risk of intoxication with clostridial toxin

XX
CC The present sequence represents a construct of the invention, comprising
CC a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC be cleaved by thrombin, and a heavy chain derived from botulinum
CC neurotoxin serotype B. The specification describes a composition for
CC delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC This component has a domain that binds to a neuronal cell and a domain
CC that translocates the SOD of the composition into the neuronal cell.
CC After translocation, the linker is cleaved to release the SOD. The
CC composition is useful for treating neuronal diseases caused or augmented
CC by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC disease, Huntington's disease and motor neurone diseases

XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast. Note: This
CC   sequence is not given in the specification, but is decoded from the BoNTB
CC   Hc DNA sequence given on pages 39-40

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 4b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

CC   The present sequence represents a recombinant neurotoxin protein from the
CC   present invention. The present invention describes recombinant neurotoxin
CC   proteins which comprise a first and second domain, where the first domain
CC   is adapted to cleave one or more vesicle or plasma-membrane associated
CC   proteins essential to exocytosis, and where the second domain is adapted:
CC   (a) to translocate the protein into a cell; (b) to increase the
CC   solubility of the protein compared to the solubility of the first domain
CC   on its own, or (c) both to translocate the protein into a cell and to
CC   increase the solubility of the protein compared to the solubility of the
CC   first domain on its own, the protein being free of clostridial neurotoxin
CC   (CN) and free of CN precursor that can be converted into toxin by
CC   proteolytic action. The recombinant proteins can be used as therapeutic
CC   agents for targeting cells expressing a relevant substrate. The products
CC   can also be used as immunogens and as non-toxic standards for the
CC   assessment and development of in vitro assays for the detection of
CC   functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC   environmental samples

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 49; Page 376-378; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (113/30 strain) type G neurotoxin, encoded by a DNA
CC sequence (see AAV30596) in plasmid pETHisb. This vector can be used to
CC express BotG soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which
CC allow for the isolation of soluble recombinant proteins free of
CC significant endotoxin contamination. Preferred hosts for production of
CC recombinant proteins are E. coli, insect cells and yeast cells. The
CC recombinant toxins are used as immunogens for the production of vaccines
CC and antitoxins that are useful in the treatment of humans and animals at
CC risk of intoxication with clostridial toxin

PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum

PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 28; Page 47-48; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 10b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 24; Page 265-267; 428pp; English.
XX
CC This is the amino acid sequence of a histidine-tagged fragment C
CC polypeptide of Clostridium botulinum serotype A toxin encoded by a DNA
CC sequence (see AAV30572) in plasmid pHisBot, and by a DNA sequence (see
CC AAV30575) in pHisBotA. These vectors were used to express native (i.e.
CC non-fusion) soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on a poly-histidine binding
CC affinity resin. The invention relates to recombinant proteins derived
CC from C. botulinum toxins. Methods are provided which allow the isolation
CC of soluble recombinant proteins that are free of significant endotoxin
CC contamination. Preferred hosts for production of recombinant proteins are
CC E. coli, insect cells and yeast cells. The recombinant toxins are used as
CC immunogens for the production of vaccines and antitoxins that are useful
CC in the treatment of humans and animals at risk of intoxication with
CC clostridial toxin

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC       BOND OF SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
```

```
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PS Example 35; Page 303-305; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (Danish strain) type B toxin, encoded by a DNA
CC sequence (see AAV30581) in plasmid pETHisb. This vector was used to
CC express soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins. Methods
CC are provided which allow for the isolation of soluble recombinant

```
CC   proteins free of significant endotoxin contamination. Preferred hosts for
CC   production of recombinant proteins are E. coli, insect cells and yeast
CC   cells. The recombinant toxins are used as immunogens for the production
CC   of vaccines and antitoxins that are useful in the treatment of humans and
CC   animals at risk of intoxication with clostridial toxin

PS   Disclosure; Page 45-47; 65pp; English.
XX
CC   The present sequence represents a construct of the invention, comprising
CC   a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC   be cleaved by thrombin, and a heavy chain derived from botulinum
CC   neurotoxin serotype B. The specification describes a composition for
CC   delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC   by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC   This component has a domain that binds to a neuronal cell and a domain
CC   that translocates the SOD of the composition into the neuronal cell.
CC   After translocation, the linker is cleaved to release the SOD. The
CC   composition is useful for treating neuronal diseases caused or augmented
CC   by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC   disease, Huntington's disease and motor neurone diseases

PT   risk of intoxication with clostridial toxin.
XX
PS   Example 35; Page 291-296; 428pp; English.
XX
CC   This is the amino acid sequence of the type B toxin of Clostridium
CC   botulinum Danish strain. The C fragment (see AAW68393-94) of the serotype
CC   B toxin has been expressed as a histidine-tagged protein in Escherichia
CC   coli. The invention relates to C. botulinum recombinant toxins. Methods
CC   are provided which allow for the isolation of soluble recombinant
CC   proteins free of significant endotoxin contamination. Preferred hosts for
CC   production of the recombinant proteins are E. coli, insect cells and
CC   yeast cells. The recombinant proteins are used as immunogens for the
CC   production of vaccines and antitoxins that are useful in the treatment of
CC   humans and animals at risk of intoxication with clostridial toxin.
CC   (Updated on 17-OCT-2003 to standardise OS field)

PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 23; Page; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast. Note: This
CC sequence is not given in the specification, but is decoded from the BoNTB
CC Hc DNA sequence given on pages 39-40

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 4b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

XX
CC The present sequence represents a recombinant neurotoxin protein from the
CC present invention. The present invention describes recombinant neurotoxin
CC proteins which comprise a first and second domain, where the first domain
CC is adapted to cleave one or more vesicle or plasma-membrane associated
CC proteins essential to exocytosis, and where the second domain is adapted:
CC (a) to translocate the protein into a cell; (b) to increase the
CC solubility of the protein compared to the solubility of the first domain
CC on its own, or (c) both to translocate the protein into a cell and to
CC increase the solubility of the protein compared to the solubility of the
CC first domain on its own, the protein being free of clostridial neurotoxin
CC (CN) and free of CN precursor that can be converted into toxin by
CC proteolytic action. The recombinant proteins can be used as therapeutic
CC agents for targeting cells expressing a relevant substrate. The products
CC can also be used as immunogens and as non-toxic standards for the
CC assessment and development of in vitro assays for the detection of
CC functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC environmental samples

XX
PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Disclosure; Page 13; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
```

```
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 35; Page 300-302; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Eklund 17B strain) type B toxin, encoded by a DNA
CC   sequence (see AAV30580) in plasmid pHisBotb. This vector was used to
CC   express soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins. Methods
CC   are provided which allow for the isolation of soluble recombinant
CC   proteins free of significant endotoxin contamination. Preferred hosts for
CC   production of recombinant proteins are E. coli, insect cells and yeast
CC   cells. The recombinant toxins are used as immunogens for the production
CC   of vaccines and antitoxins that are useful in the treatment of humans and
CC   animals at risk of intoxication with clostridial toxin

XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum seotype D neurotoxin, encoded by a DNA sequence
CC   (see AAV30591) in plasmid pETHisb. This vector can be used to express
CC   BotD soluble C fragment in Escherichia coli host cells, with the
CC   recombinant C fragment being purified on an affinity column. The
CC   invention relates to recombinant proteins derived from C. botulinum
CC   toxins, especially type B and type E toxins. Methods are provided which
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts are E. coli, insect
CC   cells and yeast cells. The recombinant toxins are used as immunogens for
CC   the production of vaccines and antitoxins useful in the treatment of
CC   humans and animals at risk of intoxication with clostridial toxin

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Probably play a role in the development of the brain and
CC       the sense organs. Can bind to the BCD target sequence (BTS): 5'-
CC       TCTAATCCC-3' (By similarity). May play a role in the specification
CC       or differentiation of neurons in the deep layers of the cerebral
CC       cortex, and also in cerebellar regionalization during early
CC       development.
CC   -!- SUBCELLULAR LOCATION: Nuclear (Probable).
CC   -!- TISSUE SPECIFICITY: Brain: restricted regions of the developing
CC       rostral brain including the presumptive cerebral cortex and
CC       olfactory bulbs; expressed in the developing olfactory, auricolar
CC       and ocular systems, including the covering of the optic nerve (By
CC       similarity).
CC   -!- DEVELOPMENTAL STAGE: Expressed throughout the forebrain and
CC       midbrain during development, and in addition is also seen in
CC       discrete spatial and temporal domains in the developing cerebral
CC       cortex and cerebellum. Confined to a subpopulation of neurons in
CC       layers 5 and 6 within the adult cerebral cortex and during
CC       development expression is high in the progenitors of these deep-
CC       layer cells. Expressed in the developing cerebellum in spatially
CC       restricted regions of the external granular layer.
CC   -!- SIMILARITY: Belongs to the paired homeobox family. Bicoid
CC       subfamily.
CC   -!- SIMILARITY: Contains 1 homeobox domain.

CC   -!- FUNCTION: MULTIFUNCTIONAL TRANSCRIPTION FACTOR THAT EXHIBITS
CC       POSITIVE AND NEGATIVE CONTROL ON A LARGE NUMBER OF CELLULAR AND
CC       VIRAL GENES BY BINDING TO SITES OVERLAPPING THE TRANSCRIPTION
CC       START SITE. MAY PLAY AN IMPORTANT ROLE IN DEVELOPMENT AND
CC       DIFFERENTIATION. THE FUNCTION OF YY1 AS AN ACTIVATOR OR A
CC       REPRESSOR IS SPECIFIED BY THE PRESENCE OF OTHER PROTEINS. FOR
CC       EXAMPLE IT ACTS AS A REPRESSOR IN ABSENCE OF ADENOVIRUS E1A
CC       PROTEIN BUT AS AN ACTIVATOR IN ITS PRESENCE.
CC   -!- SUBUNIT: Interacts with YAF2 through the region encompassing the
CC       first and second zinc fingers.
CC   -!- SUBCELLULAR LOCATION: Nuclear. Associated with the nuclear matrix.
CC   -!- SIMILARITY: BELONGS TO THE KRUEPPEL FAMILY OF C2H2-TYPE ZINC-
CC       FINGER PROTEINS.
CC   -!- SIMILARITY: Contains 3 C2H2-type zinc fingers.

CC   -!- FUNCTION: MULTIFUNCTIONAL TRANSCRIPTION FACTOR THAT EXHIBITS
CC       POSITIVE AND NEGATIVE CONTROL ON A LARGE NUMBER OF CELLULAR AND
CC       VIRAL GENES BY BINDING TO SITES OVERLAPPING THE TRANSCRIPTION
CC       START SITE. MAY PLAY AN IMPORTANT ROLE IN DEVELOPMENT AND
CC       DIFFERENTIATION. THE FUNCTION OF YY1 AS AN ACTIVATOR OR A
CC       REPRESSOR IS SPECIFIED BY THE PRESENCE OF OTHER PROTEINS. BINDS TO
CC       THE UPSTREAM CONSERVED REGION (UCR) (5'-CGCCATTTT-3') OF MOLONEY
CC       MURINE LEUKEMIA VIRUS (MULV).
CC   -!- SUBUNIT: Interacts with YAF2 through the region encompassing the
CC       first and second zinc fingers (By similarity).
CC   -!- SUBCELLULAR LOCATION: Nuclear. Associated with the nuclear matrix.
CC   -!- SIMILARITY: BELONGS TO THE KRUEPPEL FAMILY OF C2H2-TYPE ZINC-
CC       FINGER PROTEINS.

RT   "A subclass of bHLH proteins required for cardiac morphogenesis.";
RL   Science 270:1995-1998(1995).
CC   -!- FUNCTION: Plays an essential role in cardiac morphogenesis.
CC   -!- SUBUNIT: Efficient DNA binding requires dimerization with another
CC       bHLH protein.
CC   -!- DEVELOPMENTAL STAGE: At stage 8, detected in the cardiac crescent.
CC       At stage 10, expressed thoughout the cardiac tube and the sinus
CC       venosus. By stage 15, expressed homogenously in the various
CC       regions of the heart, including the atria, future left ventricle,
CC       bulbus cordis and truncus arteriosus, and in the forming branchial
CC       arches. Expression persists through stage 20, but decreases
CC       thereafter.
CC   -!- SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 35; Page 303-305; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (Danish strain) type B toxin, encoded by a DNA
CC sequence (see AAV30581) in plasmid pETHisb. This vector was used to
CC express soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins. Methods
CC are provided which allow for the isolation of soluble recombinant

```
CC   proteins free of significant endotoxin contamination. Preferred hosts for
CC   production of recombinant proteins are E. coli, insect cells and yeast
CC   cells. The recombinant toxins are used as immunogens for the production
CC   of vaccines and antitoxins that are useful in the treatment of humans and
CC   animals at risk of intoxication with clostridial toxin

PT   Novel composition, comprising superoxide dismutase linked by a cleavable
PT   linker to a neuronal cell targeting component useful for delivering
PT   superoxide dismutase to neuronal cells to treat ischemia.
XX
PS   Disclosure; Page 45-47; 65pp; English.
XX
CC   The present sequence represents a construct of the invention, comprising
CC   a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC   be cleaved by thrombin, and a heavy chain derived from botulinum
CC   neurotoxin serotype B. The specification describes a composition for
CC   delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC   by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC   This component has a domain that binds to a neuronal cell and a domain
CC   that translocates the SOD of the composition into the neuronal cell.
CC   After translocation, the linker is cleaved to release the SOD. The
CC   composition is useful for treating neuronal diseases caused or augmented
CC   by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC   disease, Huntington's disease and motor neurone diseases

XX
CC The present sequence represents a construct of the invention, comprising
CC a mitochondrial leader sequence from human manganese superoxide dismutase
CC (Mn-SOD), a Bacillus stearothermophilus Mn-SOD, a linker that can be
CC cleaved by thrombin, and a heavy chain derived from botulinum neurotoxin
CC serotype B. The specification describes a composition for delivery of SOD
CC to neuronal cells. The composition comprises SOD linked, by a cleavable
CC linker, to a neuronal cell targeting component (NCTC). This component has
CC a domain that binds to a neuronal cell and a domain that translocates the
CC SOD of the composition into the neuronal cell. After translocation, the
CC linker is cleaved to release the SOD. The composition is useful for
CC treating neuronal diseases caused or augmented by oxidative stress, such
CC as ischemic stroke, trauma, Parkinson's disease, Huntington's disease and
CC motor neurone diseases

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 35; Page 291-296; 428pp; English.
XX
CC This is the amino acid sequence of the type B toxin of Clostridium
CC botulinum Danish strain. The C fragment (see AAW68393-94) of the serotype
CC B toxin has been expressed as a histidine-tagged protein in Escherichia
CC coli. The invention relates to C. botulinum recombinant toxins. Methods
CC are provided which allow for the isolation of soluble recombinant
CC proteins free of significant endotoxin contamination. Preferred hosts for
CC production of the recombinant proteins are E. coli, insect cells and
CC yeast cells. The recombinant proteins are used as immunogens for the
CC production of vaccines and antitoxins that are useful in the treatment of
CC humans and animals at risk of intoxication with clostridial toxin.
CC (Updated on 17-OCT-2003 to standardise OS field)

PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 23; Page; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast. Note: This
CC   sequence is not given in the specification, but is decoded from the BoNTB
CC   Hc DNA sequence given on pages 39-40

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 4b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Example 8; Page 38; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT   Recombinant neurotoxin polypeptides - used to develop therapeutic agents,
PT   immunogens or as non-toxic standards for the detection of neurotoxins.
XX
PS   Example 2; Page 91-94; 137pp; English.
XX
CC   The present sequence represents a recombinant neurotoxin protein from the
CC   present invention. The present invention describes recombinant neurotoxin
CC   proteins which comprise a first and second domain, where the first domain
CC   is adapted to cleave one or more vesicle or plasma-membrane associated
CC   proteins essential to exocytosis, and where the second domain is adapted:
CC   (a) to translocate the protein into a cell; (b) to increase the
CC   solubility of the protein compared to the solubility of the first domain
CC   on its own, or (c) both to translocate the protein into a cell and to
CC   increase the solubility of the protein compared to the solubility of the
CC   first domain on its own, the protein being free of clostridial neurotoxin
CC   (CN) and free of CN precursor that can be converted into toxin by
CC   proteolytic action. The recombinant proteins can be used as therapeutic
CC   agents for targeting cells expressing a relevant substrate. The products
CC   can also be used as immunogens and as non-toxic standards for the
CC   assessment and development of in vitro assays for the detection of
CC   functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC   environmental samples

PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum

PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 28; Page 47-48; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 10b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 24; Page 265-267; 428pp; English.
XX
CC This is the amino acid sequence of a histidine-tagged fragment C
CC polypeptide of Clostridium botulinum serotype A toxin encoded by a DNA
CC sequence (see AAV30572) in plasmid pHisBot, and by a DNA sequence (see
CC AAV30575) in pHisBotA. These vectors were used to express native (i.e.
CC non-fusion) soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on a poly-histidine binding
CC affinity resin. The invention relates to recombinant proteins derived
CC from C. botulinum toxins. Methods are provided which allow the isolation
CC of soluble recombinant proteins that are free of significant endotoxin
CC contamination. Preferred hosts for production of recombinant proteins are
CC E. coli, insect cells and yeast cells. The recombinant toxins are used as
CC immunogens for the production of vaccines and antitoxins that are useful
CC in the treatment of humans and animals at risk of intoxication with
CC clostridial toxin

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   "Nucleotide sequence of the gene coding for Clostridium botulinum
RT   (Clostridium argentinense) type G neurotoxin: genealogical comparison
RT   with other clostridial neurotoxins.";
RL   Biochim. Biophys. Acta 1216:487-491(1993).
CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
```

```
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted (By similarity).
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC       BOND OF SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-|-ILE-
CC       181 BOND IN SNAP-25.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC       SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
```

```
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: REQUIRED FOR EFFICIENT DNA REPAIR; IT CATALYZES THE
CC       UNWINDING OF DOUBLE-STRANDED DNA AND THE CLEAVAGE OF SINGLE-
CC       STRANDED DNA AND IT STIMULATES LOCAL GENETIC RECOMBINATION. ALL OF
CC       THESE ACTIVITIES REQUIRE CONCOMITANT HYDROLYSIS OF ATP (BY
CC       SIMILARITY).
CC   -!- CATALYTIC ACTIVITY: Exonucleolytic cleavage (in the presence of
CC       ATP) in either 5'- to 3'- or 3'- to 5'-direction to yield 5'-
CC       phosphooligonucleotides.
CC   -!- SUBUNIT: Consist of three subunits; recB, recC and recD (By
CC       similarity).
CC   -!- SIMILARITY: Belongs to the helicase family. UvrD subfamily.

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 152-154; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,

```
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 41; Page 324-325; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Belgua strain) type E neurotoxin, encoded by a DNA
CC   sequence (see AAV30584) in plasmid pETHisb. This vector is used to
CC   express BotE soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 6; Fig 15b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

XX
PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 26; Page 43-44; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and

```
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast

PT   risk of intoxication with clostridial toxin.
XX
PS   Example 41; Page 327-329; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (NCTC 11219) type E neurotoxin, encoded by a DNA
CC   sequence (see AAV30585) in plasmid pETHisb. This vector is used to
CC   express BotE soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
```

CC especially type B and type E toxins. Methods are provided which allow for
CC the isolation of soluble recombinant proteins free of significant
CC endotoxin contamination. Preferred hosts for production of recombinant
CC proteins are E. coli, insect cells and yeast cells. The recombinant
CC toxins are used as immunogens for the production of vaccines and
CC antitoxins that are useful in the treatment of humans and animals at risk
CC of intoxication with clostridial toxin

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Disclosure; Fig 8; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 157-159; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC conditions characterised by hyperactivity of the lower motor neuron, and
CC to control autonomic nerve function or tiptoe-walking due to stiff
CC muscles common in children with cerebral palsy. The sequences are also
CC useful for screening for botulinum neurotoxin inhibitors. This sequence
CC represents a botulinum neurotoxin light chain serotype A protein

PT Novel composition, comprising superoxide dismutase linked by a cleavable
PT linker to a neuronal cell targeting component useful for delivering
PT superoxide dismutase to neuronal cells to treat ischemia.
XX
PS Disclosure; Page 48-51; 65pp; English.
XX
CC The present sequence represents a construct of the invention, comprising
CC a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC be cleaved by thrombin, and a heavy chain derived from botulinum
CC neurotoxin serotype F. The specification describes a composition for
CC delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC This component has a domain that binds to a neuronal cell and a domain
CC that translocates the SOD of the composition into the neuronal cell.
CC After translocation, the linker is cleaved to release the SOD. The
CC composition is useful for treating neuronal diseases caused or augmented
CC by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC disease, Huntington's disease and motor neurone diseases

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC heavy chain (H). The light chain has the pharmacological activity,
CC while the N- and C-terminal of the heavy chain mediate channel
CC formation and toxin binding, respectively.
CC -!- SUBCELLULAR LOCATION: Secreted.
CC -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-|-ILE-
CC       181 BOND IN SNAP-25.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   "Organization and phylogenetic interrelationships of genes encoding
RT   components of the botulinum toxin complex in proteolytic Clostridium
RT   botulinum types A, B, and F: evidence of chimeric sequences in the
RT   gene encoding the nontoxic nonhemagglutinin component.";
RL   Int. J. Syst. Bacteriol. 46:1105-1112(1996).
CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
```

```
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 152-154; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,

```
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Novel composition, comprising superoxide dismutase linked by a cleavable
PT   linker to a neuronal cell targeting component useful for delivering
PT   superoxide dismutase to neuronal cells to treat ischemia.
XX
PS   Disclosure; Page 48-51; 65pp; English.
XX
CC   The present sequence represents a construct of the invention, comprising
CC   a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC   be cleaved by thrombin, and a heavy chain derived from botulinum
CC   neurotoxin serotype F. The specification describes a composition for
CC   delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC   by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC   This component has a domain that binds to a neuronal cell and a domain
CC   that translocates the SOD of the composition into the neuronal cell.
CC   After translocation, the linker is cleaved to release the SOD. The
CC   composition is useful for treating neuronal diseases caused or augmented
CC   by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC   disease, Huntington's disease and motor neurone diseases

PT   Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT   serotype A, useful for producing the neurotoxin for vaccination against
PT   botulism, comprises sequence expressible in host other than Clostridium.
XX
PS   Claim 52; Page 157-159; 166pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

XX
PS Claim 4; Page 344-350; 434pp; English.
XX
CC Clostridium botulinum type A neurotoxin (AAR95010) is processed to form a
CC dimer composed of a light and a heavy chain. It is the product of the
CC type A neurotoxin gene (AAT29244). The 50 kDa C-terminal portion of the
CC heavy chain, or C fragment (see also AAR95008), was produced using a
CC synthetic gene (AAT29245) having codon usage altered to improve
CC expression in Escherichia coli. Fusion proteins of the type A toxin or C
CC fragment, with e.g. maltose binding protein or polyhistidine affinity tag
CC (see also AAR95008), are used to generate neutralising antitoxins and in
CC vaccine compsns

PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 26; Page 43-44; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 7b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
```

```
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   Novel modified botulism toxin or tetanus toxin comprising a protease
PT   cleavage site, is useful for treating conditions benefited by neurotoxin
PT   activity.
XX
PS   Disclosure; Fig 1; 19pp; English.
XX
CC   The invention discloses modified botulism toxin (BoTOX) or tetanus toxin
CC   (TeTOX) which contain new protease cleavage sites. These sites are
CC   created in regions where the cleavage site is specifically susceptible to
CC   cleavage by a protease that is present in effective levels only in a
CC   tissue where toxicity is undesirable and where the cleavage site itself
CC   does not inactivate the toxin. BoTOX and TeTOX are neurotoxins which are
CC   highly potent and specific poisons of neural cells. The toxins are
CC   synthesised in vivo as single chains, which are not toxic, but become
CC   active when nicked, in a post-translational modification, to form
CC   separate light and heavy chains which are linked through a disulphide
CC   bond. The modified toxins are useful to treat conditions benefited by
CC   neurotoxin activity (e.g. spastic conditions, including stabismus,
CC   bephlarospasm and hemifacial spasm, brain injury, spinal cord injury,
CC   stroke, multiple sclerosis and cerebral palsy) by administering the
CC   toxins for their localised production. The advantage of the toxins are
CC   that they are deactivated in tissues where toxic activity is undesirable
CC   and activated at desired targets. The sequence presented is the
CC   Clostridium botulinum botulism A toxin (BoNT/A) protein

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 41; Page 324-325; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (Belgua strain) type E neurotoxin, encoded by a DNA
CC sequence (see AAV30584) in plasmid pETHisb. This vector is used to
CC express BotE soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins,
CC especially type B and type E toxins. Methods are provided which allow for
CC the isolation of soluble recombinant proteins free of significant
CC endotoxin contamination. Preferred hosts for production of recombinant
CC proteins are E. coli, insect cells and yeast cells. The recombinant
CC toxins are used as immunogens for the production of vaccines and
CC antitoxins that are useful in the treatment of humans and animals at risk
CC of intoxication with clostridial toxin

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Disclosure; Fig 8; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Recombinant neurotoxin polypeptides - used to develop therapeutic agents,
PT immunogens or as non-toxic standards for the detection of neurotoxins.
XX
PS Example 2; Page 91-94; 137pp; English.
XX
CC The present sequence represents a recombinant neurotoxin protein from the
CC present invention. The present invention describes recombinant neurotoxin
CC proteins which comprise a first and second domain, where the first domain
CC is adapted to cleave one or more vesicle or plasma-membrane associated
CC proteins essential to exocytosis, and where the second domain is adapted:
CC (a) to translocate the protein into a cell; (b) to increase the
CC solubility of the protein compared to the solubility of the first domain
CC on its own, or (c) both to translocate the protein into a cell and to
CC increase the solubility of the protein compared to the solubility of the
CC first domain on its own, the protein being free of clostridial neurotoxin
CC (CN) and free of CN precursor that can be converted into toxin by
CC proteolytic action. The recombinant proteins can be used as therapeutic
CC agents for targeting cells expressing a relevant substrate. The products
CC can also be used as immunogens and as non-toxic standards for the
CC assessment and development of in vitro assays for the detection of
CC functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC environmental samples

PT   New polypeptide, useful for treating infections of Clostridium tetani,
PT   comprises tetanus toxin fragment with a mutation in a loop region,.
XX
PS   Disclosure; Page 39; 43pp; English.
XX
CC   The present sequence is given in a specification relating to a novel
CC   polypeptide comprising tetanus toxin (TeNT) fragment C or its immunogenic
CC   fragment, containing a mutation in a loop region. The mutation results in
CC   a reduction in the binding of TeNT fragment C or its immunogenic fragment
CC   to gangliosides and primary motoneurones, and/or a reduction in the
CC   ability of TeNT fragment C or its immunogenic fragment to undergo
CC   retrograde transport. The polypeptide is useful for treating, preventing
CC   and reducing the susceptibility to Clostridium tetani infection in a
CC   human or animal, and also for producing antibodies which recognise groups
CC   within TeNT polypeptides. Antibody produced against the polypeptide is
CC   also useful for treating Clostridium tetani infection

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 33; Page 125-126; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC conditions characterised by hyperactivity of the lower motor neuron, and
CC to control autonomic nerve function or tiptoe-walking due to stiff
CC muscles common in children with cerebral palsy. The sequences are also
CC useful for screening for botulinum neurotoxin inhibitors. This sequence
CC represents a botulinum neurotoxin light chain serotype A protein

US-08-480-604A-28
; Sequence 28, Application US/08480604A
; Patent No. 5736139
; GENERAL INFORMATION:
; APPLICANT: KINK, JOHN A.
; APPLICANT: THALLEY, BRUCE S.
; APPLICANT: PADHYE, NISHA V.
; APPLICANT: FIRCA, JOSEPH R.
; APPLICANT: STAFFORD, DOUGLAS C.
; TITLE OF INVENTION: VACCINE AND ANTITOXIN FOR TREATMENT AND
; TITLE OF INVENTION: PREVENTION OF C. DIFFICILE DISEASE
; NUMBER OF SEQUENCES: 32
; CORRESPONDENCE ADDRESS:
; ADDRESSEE: MEDLEN & CARROLL, LLP
; STREET: 220 MONTGOMERY STREET, SUITE 2200
; CITY: SAN FRANCISCO
; STATE: CALIFORNIA
; COUNTRY: UNITED STATES OF AMERICA
; ZIP: 94104
; COMPUTER READABLE FORM:
; MEDIUM TYPE: Floppy disk
; COMPUTER: IBM PC compatible
; OPERATING SYSTEM: PC-DOS/MS-DOS
; SOFTWARE: PatentIn Release #1.0, Version #1.30
; CURRENT APPLICATION DATA:
; APPLICATION NUMBER: US/08/480,604A
; FILING DATE: 07-JUN-1995
; CLASSIFICATION: 424
; PRIOR APPLICATION DATA:
; APPLICATION NUMBER: US 08/422,711
; FILING DATE: 14-APR-1995
; PRIOR APPLICATION DATA:
; APPLICATION NUMBER: US 08/405,496
; FILING DATE: 16-MAR-1995
; PRIOR APPLICATION DATA:
; APPLICATION NUMBER: US 08/329,154
; FILING DATE: 25-OCT-1994
; PRIOR APPLICATION DATA:
; APPLICATION NUMBER: US 08/161,907
; FILING DATE: 02-DEC-1993
; PRIOR APPLICATION DATA:
; APPLICATION NUMBER: US 07/985,321
; FILING DATE: 04-DEC-1992
; PRIOR APPLICATION DATA:
; APPLICATION NUMBER: US 07/429,791
; FILING DATE: 31-OCT-1989
; ATTORNEY/AGENT INFORMATION:
; NAME: INGOLIA, DIANE E.
; REGISTRATION NUMBER: 40,027

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: Structural studies on the zinc-endopeptidase light chain of tetanus neurotoxin.
A;Reference number: S69348; MUID:95262688; PMID:7744050
A;Accession: S69348
A;Molecule type: protein
A;Residues: 2-31 <DEF>
C;Comment: The source of this protein was an extrachromosomal plasmid.
C;Comment: The precursor is cleaved by endogenous proteinase activity to form light (fra
C;Comment: dual chains are not toxic when separated). The amino end of the heavy chain (fragment B)
C;Comment: Fragment B forms ion channels in a lipid bilayer. Fragment C binds to ganglio
C;Comment: This potent neurotoxin binds to peripheral neuronal synapses, is internalized,
 presynaptic neurons. It inhibits neurotransmitter release by proteolytic cleavage of syr
C;Function:
A;Description: blocks neuroexocytosis via hydrolysis of a Gln-Phe peptide bond in synaptc
C;Superfamily: tetanus toxin
C;Keywords: hydrolase; metalloproteinase; neurotoxin; transmembrane protein; zinc
F;2-457/Product: tentoxylysin light chain (fragment A) #status predicted <TTL>
F;461-1315/Product: tentoxylysin heavy chain (fragment B.C) #status experimental <TTH>
F;461-864/Domain: channel forming (fragment B) #status predicted <TXB>
F;865-1315/Domain: ganglioside binding (fragment C) #status predicted <TXC>
F;233,237/Binding site: zinc (His) #status predicted

CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC heavy chain (H). The light chain has the pharmacological activity,
CC while the N- and C-terminal of the heavy chain mediate channel
CC formation and toxin binding, respectively.
CC -!- SUBCELLULAR LOCATION: Secreted.
CC -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-|-ILE-
CC       181 BOND IN SNAP-25.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC       BOND OF SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   components of the botulinum toxin complex in proteolytic Clostridium
RT   botulinum types A, B, and F: evidence of chimeric sequences in the
RT   gene encoding the nontoxic nonhemagglutinin component.";
RL   Int. J. Syst. Bacteriol. 46:1105-1112(1996).
CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
```

```
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.
